

**Insite Real-Time ATM** | Eliminate the need of manually swapping data between disjointed systems with this real-time ATM processing solution.

### A Powerful Module

Automated Systems offers a cost-effective real-time ATM processing solution. This solution provides operational efficiencies over traditional batch processing. The key to real-time processing is the transaction server, which is used to facilitate the flow of transaction information between the transaction origination point and the Insite Banking System application database. The real-time connection eliminates the need of manually “swapping” data between disjointed systems and provides up-to-the-minute account memo balances.

The adoption of a real-time ATM processing solution can lead to lower collection costs as previous inefficiencies that created the potential for customers to draw on negative fund balances are eliminated. Real-time ATM processing results in a customer’s balance information being simultaneously updated in both the bank and the ATM databases following a transaction, which eliminates the potential for drawing on “phantom funds.”

### Reliable Providers

Automated Systems works with well-established and trusted companies to bring you an efficient and reliable ATM solution. Some of these companies include SHAZAM, Star, FifthThird, and TransFund. The relationship that has been built between Automated Systems and the companies listed are a testament to the presence of Automated Systems in the current banking industry.

Benefits of Insite Real-Time ATM

- Enhance customer banking experience
- Lower collection costs
- Real-time account memo balances
- Eliminate “float”
